

In the Specification:

✓
Please rewrite paragraphs 0025, 0046, and 0049 as follows:

B1
[0025] It will be noted that more than one clear top coat may be applied, if desired. One coat may be sufficient for most situations, but two or more coats, such as a second or third clear coat, may be desirable in other situations. This is shown in Fig. 1, the block identified by reference numeral 18, thus providing four or more coats.

B2
[0046] The patterned layer may be an aliphatic polyurethane product, or polyester film, or other appropriate film. The top or outer clear layer may likewise be a polyester layer, such as DuPont's "MYLAR" product, or other appropriate plastic product. It will be noted that the same plastic for the patterned and outer layers may be either in liquid form for spraying, as discussed for the methods 10 and 30, or in film form, as discussed for the method 50.

B3
[0049] The various coats may be either relatively flexible or relatively inflexible. That is, they may flex easily or they may not flex easily. In some cases a relatively inflexible bedliner may be advantageous and in other cases a relatively flexible bedliner may be advantageous.
